Blood Request Web App – Project Summary

This project is a simple web application built using Python and Flask. It allows users to submit blood donation requests through a form, view all submitted requests in a table, and download the data as a CSV file. Data is stored locally using a CSV file instead of a database, making it lightweight and easy to manage.

- Key Features:

• Submit blood request form

• View all requests in a table

• Download requests as a CSV file

• No database required – uses CSV

• Fully uploaded and documented on GitHub
